We made a cloud solution to manage your ISP, it learns from your actions and helps you the way through your growth. Would you like to try?

Three years ago we started the long road, into shaping a cloud solution for isp billing, network management, tickets management, organizing and promoting company. All these and more to come to be handled in a single interface.

With a continuous integration we aim to achieve a more rich and stable version in assisting you to manage your ISP, by balancing User Interface, User Experience and Business Logic. With the growth of web development tools, we were able to scale our platform to bare 30+ companies at first two years, in other numbers there were 15,000 tv and 35,000 internet provisioning requests per day. So our platform handled all this heavy work without a fuss.

We are crafted on developing web apps, so our cloud solution relies on most modern web development technologies, adding the power of DigitalOcean's cloud infrastructure, we are able to do almost anything.

Our cloud platform uses Laravel framework on the backend and a custom made stack on frontend, our frontend is designed by our passionate designer in cooperation with designers from Amsterdam.. Also we have a great online support team which will handle your company's establishment in using our software.

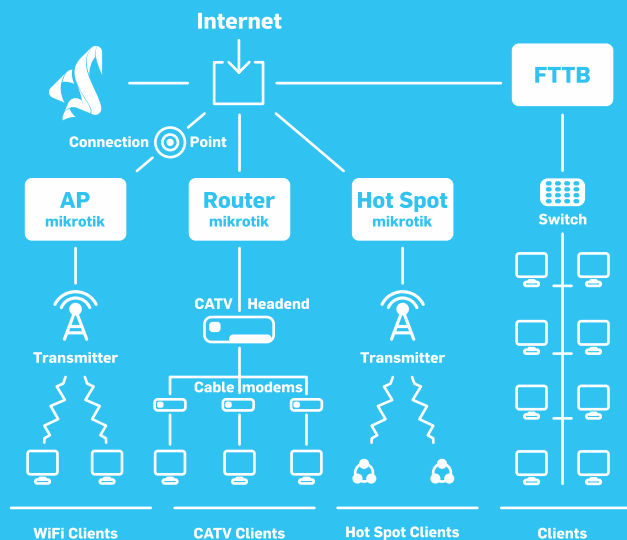

Internet and Television provisioning **AlbiSmart** has settled the communication between some conax hosters in balkans, your linux servers and MikroTik devices,

by enabling you to manage all your infrastructure on the cloud in one interface.

In conax manner we provide Bring Your Own Conax Hoster application.

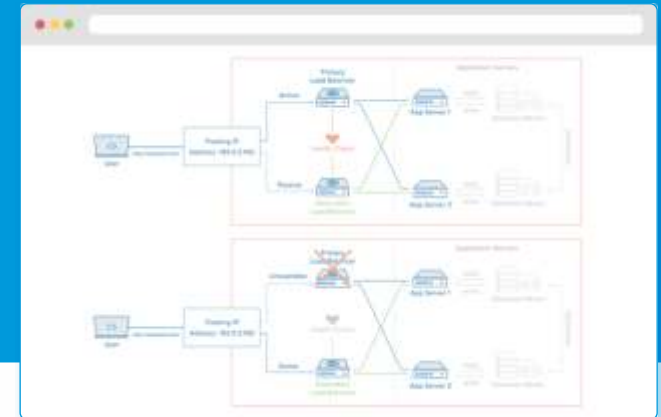

Current viable protocols are Dhcp and PPPoE, with which you can manage your WiFi, CATV, Radius Management, FTTB and FTTH networks.

WIFI management **CATV management** **HOT SPOT management** **FTTB management**

What if **AlbiSmart** goes offline?

In digitalocean.com after their floating ip release there is no offline time, we've got server replication providing redundancy and in emergency cases in almost no time your communication we'll be handled by different server inside DigitalOcean infrastructure without bothering you, and it will come back online synchronizing with secondary servers without bothering you again.

What about my data privacy?

We've got a fully covered page on our site www.albismart.com/privacy so we never use or sell your company or clients data, we just apply patterns on your signals, bandwidth and network statistics data in order to predict what may be coming over to cause a failure in your network and let you know about it before it happens or what it may happened.

You are willing to try, but there might be implications in the migration transition?

No worries, we've got you covered, our professional network team will handle this transition for you providing 30 days money back guaranteed, we'll move all your current users within 2 business days...

How can you apply for your account?

Navigate to www.albismart.com and apply today, set an appointment for your migration or installation, and our staff will get in touch to confirm your appointment. Sooner or later you'll be operating in the cloud.

Everything ok till now, but I've got so many questions?

Yeah sure, you can email us gazillion emails at info@albismart.com we'll do our best to give you the answers, and soon we plan to release a public forum & blog to keep you up to date and let you publish your questions and discuss with ISP community together.
